## <u>AMENDMENTS</u>

Please amend the claims as follows. The below listing of claims is intended to replace all prior versions of the claims.

## 1-40. (Canceled)

- 41. (Currently Amended) A test strip for analyzing an analyte comprising a flexible flat support on which one or several test fields are arranged next to one another, wherein said test fields carry one or several detection layers stacked on top of one another each detection layer including a reagent which provides a signal visibly detectable through the support layer in the presence of the analyte and wherein the detection layers are directly contacted by an overlay made of a spreading material comprising a porous flat structure impregnated with a wetting agent, wherein the wetting agent is N-oleoyl-sarcosinate.
- 42. (Previously Presented) The test strip of claim 41 wherein the overlay comprises one or several flat overlay elements which are attached to the test strip in such a way that a part of their surface can be displaced freely relative to the strip surface when the test strip is bent towards a side on which the overlay is located.
- 43. (Previously Presented) The test strip of claim 42 wherein the detection layers are covered by the parts of the overlay elements that can be displaced freely relative to the strip surface.
- 44. (Previously Presented) The test strip of claim 42 wherein the overlay comprises two overlay elements whose parts that can be displaced freely relative to the strip surface face one another and overlap.
- 45. (Previously Presented) The test strip of claim 44 wherein the overlap covers two test fields.

46. (Previously Presented) The test strip of claim 41 wherein the test strip comprises

two single or multilayer test fields for the same or different diagnostically usable analytes, said

test fields directly adjoining one another or being separated by a gap.

47. (Previously Presented) The test strip of claim 41 wherein the arrangement of

detection layers and overlays on the test strip is covered with an inert flat material in such a

manner that a space only remains free that is adequate for sample application in an overlap

region of the overlay elements viewed in the direction of the longitudinal axis of the test strip.

48. (Previously Presented) The test strip of claim 41 wherein the hydrophilicity,

transparency and liquid conducting capacity of the overlay material are matched in such a

manner that a sample excess is not taken up by the strip.

49-55. (Canceled)

56. (Previously Presented) A test strip comprising a flexible flat support in which one

or several test fields are arranged next to one another, said test fields carrying one or several

detection layers stacked on top of one another, said test field supporting a monofilament

spreading material which is larger than the test field and is attached to the support on both sides

of the test field by means of a spacer having the thickness of the test field whereby the part of the

spreading material which extends beyond the test field is covered by sample-impermeable

material so that a sample application is only possible on that part of the spreading material which

rests on the test field, the spreading material comprising a porous flat structure impregnated with

a wetting agent, wherein the wetting agent is N-oleoyl-sarcosinate.

57. (Currently Amended) A test strip comprising a flexible flat support on which one

or several test fields are arranged next to one another, said test fields carrying one or several

detection layers stacked on top of one another and covered by an overlay made of a spreading

material comprising a porous flat structure impregnated with a wetting agent, wherein the

wetting agent is N-oleoyl-sarcosinate, and wherein the test fields are covered by the parts of the

overlay elements that can be displaced freely relative to the test fields, said one or several

detection layers carrying a reagent, which can be observed for signal formation through the

support layer.

58. (Previously Presented) The test strip of claim 57 wherein the hydrophilicity,

transparency and liquid conducting capacity of the overlay material are matched in such a

manner that a sample excess is not taken up by the strip.

59. (Previously Presented) The test strip of claim 57 wherein the test strip comprises

two single or multilayer test fields for the same or different diagnostically usable analytes, said

test fields directly adjoining one another or being separated by a gap.

60. (Previously Presented) The test strip of claim 57 wherein the spreading material

comprises 0.01 to 3.0% by weight of N-oleoyl-sarcosinate relative to the weight of the material

before impregnation.

61. (Previously Presented) A test strip comprising a flexible flat support on which one

or several test fields are arranged next to one another, wherein said test fields carry one or

several detection layers stacked on top of one another, and wherein the test fields are covered

two overlay elements whose parts overlap and which can be displaced freely relative to the strip

surface face one another when the test strip is bent towards a side on which the overlay is

located, said overlay elements made of a spreading material comprising a porous flat structure

impregnated with a wetting agent, wherein the wetting agent is N-oleoyl-sarcosinate.

62. (Previously Presented) The test strip of claim 61 wherein the overlap covers two

test fields.
